

Line Detection using Hough Transform

Detection of Lines

- Real-world images often show straight lines, such as edges of buildings, lane borders, or power poles

Detection of Lines

An edge detector is first used to map a given image into a binary edge map

- How to describe a line?

Parameter space representation

- A line in the image corresponds to a point in Hough space

Parameter space representation

- What does a point (x_0, y_0) in the image space map to in the Hough space?

Parameter space representation

- What does a point (x_0, y_0) in the image space map to in the Hough space?
 - Answer: the solutions of $b = -x_0m + y_0$
 - This is a line in Hough space

Parameter space representation

- Where is the line that contains both (x_0, y_0) and (x_1, y_1) ?

Parameter space representation

- Where is the line that contains both (x_0, y_0) and (x_1, y_1) ?
 - It is the intersection of the lines $b = -x_0m + y_0$ and $b = -x_1m + y_1$

Hough transform

- An early type of voting scheme
- General outline:
 - Discretize parameter space into bins
 - For each feature point in the image, put a vote in every bin in the parameter space that could have generated this point
 - Find bins that have the most votes

Image space

Hough parameter space

P.V.C. Hough, *Machine Analysis of Bubble Chamber Pictures*, Proc. Int. Conf. High Energy Accelerators and Instrumentation, 1959

Parameter space representation

- Problems with the (m,b) space:
 - Unbounded parameter domain
 - Vertical lines require infinite m

Parameter space representation

- Problems with the (m,b) space:
 - Unbounded parameter domain
 - Vertical lines require infinite m
- Alternative: polar representation

Each point will add a sinusoid in the (θ, ρ) parameter space

Algorithm outline

- Initialize accumulator H to all zeros
- For each edge point (x,y) in the image
 - For $\theta = 0$ to 180
 - $\rho = x \cos \theta + y \sin \theta$
 - $H(\theta, \rho) = H(\theta, \rho) + 1$
 - end
- end
- Find the value(s) of (θ, ρ) where $H(\theta, \rho)$ is a local maximum
 - The detected line in the image is given by
 - $\rho = x \cos \theta + y \sin \theta$

H: accumulator array (votes)

Circle

Several lines

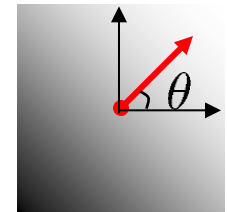

A more complicated image

Incorporating image gradients

- To deal with noise, Try to get rid of irrelevant features
Take only edge points with significant gradient magnitude
 - Recall: when we detect an edge point, we also know its gradient direction
 - But this means that the line is uniquely determined!
 - Modified Hough transform:
 - For each edge point (x,y)
 - θ = gradient orientation at (x,y)
 - $\rho = x \cos \theta + y \sin \theta$
 - $H(\theta, \rho) = H(\theta, \rho) + 1$
- end

The diagram shows a square grayscale gradient transitioning from dark gray on the left to light gray on the right. A red arrow originates from a point on the gradient, pointing towards the upper right. A horizontal axis and a vertical axis are shown, with the angle between the horizontal axis and the red arrow labeled θ .

$$\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$
$$\theta = \tan^{-1} \left(\frac{\partial f}{\partial y} / \frac{\partial f}{\partial x} \right)$$
